

Disposable Biodegradable - Compostable

Catalog 2021 |

we care⁴®

About us

We were born in 2009, we are pioneers in the category providing the solution of biodegradable - compostable disposables in Mexico with the objective of reducing plastic.

MISSION

Activate and promote the change of habits to reduce the consumption of plastic.

VIEW

We are a company characterized by the perfect balance between innovation and sustainability, to reduce our footprint on the planet. Our integral service is the competitiveness in the category. We work with nature

Values

COMPOSTABLE: OUR FIRST CHOICE

In each product that we select, we look for the highest category of biodegradability, which is compostability.

YOUR NEED, MY OPPORTUNITY

Our portfolio with more than 200 products covers any personal or business need.

We want to be part of the movement in changing responsible habits with the environment; turn your everyday day into another day where

reduce your footprint on the planet.

INNOVATION IN EVERY ACTION

Our commitment is to work with nature. Now each action has the challenge of evolution, innovation and international sustainable vision, which makes a difference in the category and in the environment.

We work with nature.

Cornstarch

Corn Starch products are made from a biopolymer derived from plant starch. They are as rigid as traditional plastics with the advantage of being biodegradable, thus being a functional and sustainable product.

Wheat Bagasse

Natural fibers extracted from wheat in its fermentation process, resulting in an extract called bagasse. The visual finish on products with this material is an attractive brown color that evokes sustainability.

Sugarcane Bagasse

Fibrous residue extracted from sugar cane. The composition of the material contains 60% plant fibers and 40% water. The homogeneous material produced is compostable, it is resistant to various temperatures, and its ease of molding generates different product proposals.

Resistant to cold and heat.

Resistant to cold and heat.

microwave safe

Resistant to cold and heat.

microwave safe

Polylactic Acid

Polylactic acid or polylactic acid (PLA) is a polymer made up of lactic acid molecules that is born from the extraction of glucose and dextrose from starch derived from plant origin, providing the special quality of visual transparency and in turn being a biodegradable material - compostable.

PLA paper

PLA Paper is a composite material between recycled paper and PLA laminate. It is obtained from the extraction of dextrose and glucose from the starch of some fruits to later ferment it with lactic acid. This mined on paper is what generates resistance to liquids.

PBAT

It is a biodegradable synthetic aromatic aliphatic copolyester, derived primarily from 1,4-butanediol. The combination of these materials offers biodegradability, weight resistance and aromatic quality with the 0% plastic compostable property. It is composed of 50% PBAT + 35% cornstarch + 15% PLA

Cold resistant.

Resistant to cold and heat.

0% Plastic.

Product compostable

sustainability

The situation of plastic has invaded and affected the environment in large dimensions, but together with the "new" forms of consumerism, actions in our daily lives such as drinking coffee in a disposable cup, become a problem.

There is a part of the population sensitive to these issues, which is aware that it is time to change

habits and is willing to pay more for not polluting, simply to contribute to the conservation of the planet where the ideal would be to have that daily coffee in a reusable cup, but when that ideal occurs there must be another alternative. A disposable but compostable cup, where its biodegradation takes place in just a few months, is the best option. It is the differentiating factor of the category.

Environmental Impact 2020

The substitution of plastic waste is an advance in changing habits that promotes the reduction of our footprint on the planet.

In 2020 we managed to reduce:

25.7 41.2

Tons of Styrofoam

+84.4%

Tons of plastic thermal paper

+98%

32.1 >

Tons of PET plastic

+57.9%

99

Tons of plastic waste

+81.5%

■ 2019 ■ 2020

Compostable and Reusable is already another way of living.

Did you know?

Biodegradable:

It is all matter with the ability to decompose when it comes into contact with the element of the environment such as temperature, humidity and biological organisms over an indefinite period of time.

compostable:

All compostable matter is biodegradable, but it also has the mandatory characteristics of decomposing in less than 2 years and, in turn, generating its reintegration without contaminants into the earth after this cycle.

For a compostable product to start its degradation process, it is not necessary to be disposed of in a specific environment, on the contrary, this material has the ability to decompose more easily than any other regardless of the conditions in which it was discarded.
